

STT 811

In-Class Assignment 2

With the Northwind data,

- (1) Join together the regions and territories datasets, leaving out duplicate columns.

```
regionsTerritories <- sqldf("SELECT territories.*, regionDescription
                             FROM regions
                             INNER JOIN territories
                             WHERE regions.regionID = territories.regionID")
```

- (2) Join together customers to orders, with the result having orderID, customer name, and country.

```
customerOrders <- sqldf("SELECT orderID, companyName AS customerName, country
                         FROM customers
                         INNER JOIN orders
                         ON customers.customerID = orders.customerID")
```

- (3) Join together order details to customers, with all order detail fields and customer name.

```
customerDetails <- sqldf("SELECT order_details.*, companyName AS customerName
                         FROM order_details
                         INNER JOIN customers
                         INNER JOIN orders
                         ON order_details.orderID = orders.orderID
                         AND orders.customerID = customers.customerID")
```

- (4) Join together suppliers and shippers without a key (a Cartesian join)

```
supplierShipper <- sqldf("SELECT *
                         FROM shippers
                         INNER JOIN suppliers")
```

- (5) Join together employees to customers, with the result having customer name, country, and employee first and last name.

```
employeesToCustomers <- sqldf("SELECT companyName AS customerName,
                                customers.country, firstName, lastName
                                FROM customers
                                INNER JOIN employees
                                INNER JOIN orders
                                ON orders.employeeID = employees.employeeID
                                AND orders.customerID = customers.customerID")
```
